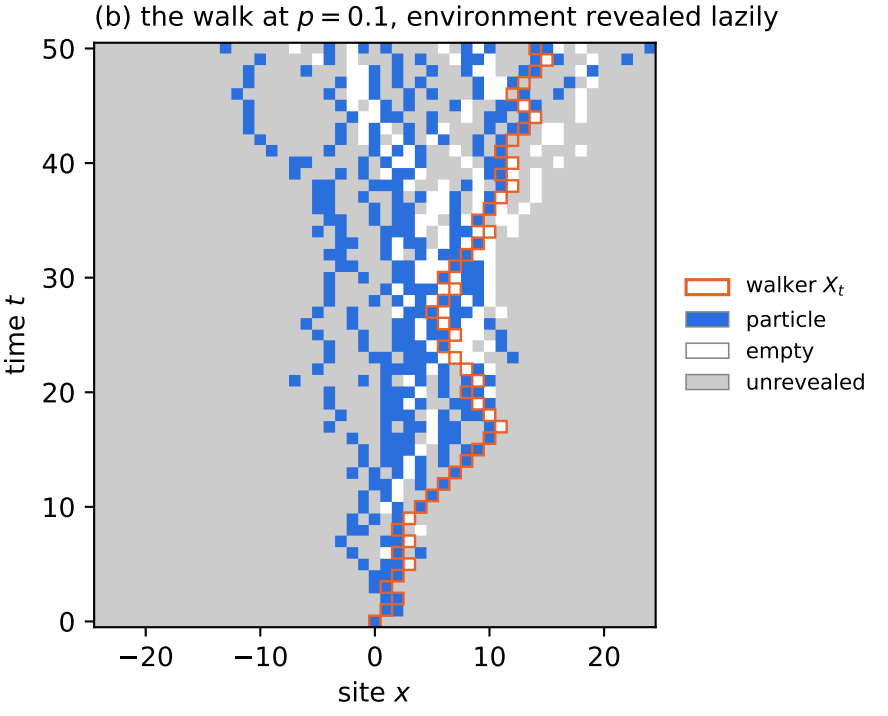
(a) one time step
walker at X_t reads $\eta_t(X_t)$
left: p if $\eta = 1$,
$1-p$ if $\eta = 0$
right: otherwise
time t
each of the 4 sweeps draws a parity b, then swaps every
bond $\{x, x+1\}$ with $x \equiv b \pmod 2$ with probability 1/2
after one sweep ($b = 0$)



(b) the walk at $p = 0.1$, environment revealed lazily
